

INLIGHT MEDICAL THERAPY

June 2018

Benefits of Light Therapy

Light therapy has beneficial responses on conditions including:

- ▶ Inflammation
- ▶ Arthritis Pain
- ▶ Back, Neck, and Joint Pain
- ▶ Carpel Tunnel Syndrome
- ▶ Wrinkles
- ▶ Hair Loss
- ▶ Neuropathy
- ▶ Bruises & Swelling
- ▶ Muscle Sprains & Strains
- ▶ Wound Healing
- ▶ Mood Disorders

Discover the Power of Light

Light is an essential nutrient of life. Using the sun's light as therapy dates back thousands of years. Modern science has evolved the engineered delivery of the sun's light into low level light therapy technology. Low-level polychromatic light therapy (PLT) is a leading-edge medical device which has steadily grown in functionality and popularity, and InLight Medical's light therapy devices have FDA Clearance. PLT helps reduce pain, promote wound healing, and support improved quality of life for people across the globe. Clinical studies and personal experiences reveal amazing health-promoting and -restoring benefits without the use of drugs, surgeries, or invasive treatments.

Don't Just Take Our Word For it

"I rented the lights for a week to work on my shoulder. I had surgery on it in March but then took a fall in June and got frozen shoulder. Using the lights on my shoulder helped me get my range of motion back again. My physical therapist was impressed and said I had the shortest frozen shoulder he had ever seen!" - Sheila

"I rented the LED lights for almost two weeks because my lower back and neck was so bad I had trouble sleeping. The lights helped me sleep better, and I now have more energy." - Louisa

Benefits of Increased Nitric Oxide

Light energy stimulates the release of nitric oxide, which dilates blood vessels and gently increases circulation/blood flow throughout the body, delivering vital nutrients for tissue repair and health promotion. Increasing nitric oxide levels in the body offers a host of benefits.

Increased localized circulation - Nitric oxide is increased locally when light energy is applied to any specific site. Along with it, blood flow increases at the same point.

Anti-Inflammation - Inflammation occurs when oxygen levels are too low, so increasing blood flow via nitric oxide reduces inflammation.

Tissue regeneration - Tissues that need to heal require oxygen, nutrients, ATP and growth factors. Nitric oxide provides an environment for enhanced healing by providing better blood flow.

Pain reduction - Pain occurs when oxygen levels in the nerves are too low. Think of how painful your finger becomes if you wrap a rubber band around it. The rubber band cuts off blood flow, thereby depriving nerves and other cells of oxygen. The pain recedes when the rubber band is removed.
